Board Description

This merger board seeks to combine the SCALES EPS board with the SCALES IMX8 Carrier Board. Both boards have undergone three revisions, this merger will combine the final revisions of both with each of them undergoing some more modifications based on seperate board reviews. Notable differences for each board compared to their individual counterparts are listed below.

Changes requested by True from Phytec were applied, based on the returned file 'imx8_carrier_v3_dsmith.pdf' recieved on 11/6/2025

EPS WD/Power On Conn. Ops

Power requirements per subsystem
OBC: 28v to 3.3v @ 2A
Jetson: 28v to 20v @ 4A
Perif: 28v to 5v @ 2A

Power on sequencing:
OBC powers when Vbatt is supplied. OBC controls operation of the Jetson as well as the Peripheral system via GPIO pins to the respective subsystem load switch.

Startup time for the Jetson on enable is ~10ms
Startup time for the Peripheral on enable is ~1ms
Startup time for the OBC on boot is ~1ms

Vbatt = [24.0, 28.8, 33.6] Due to Li-Ion battery charged and discharged states

Signal point ground from power board to rest of system

I2C Addresses Being Used:

INA260 OBC Subsystem: 0x41 (01000001)
INA260 Perif. Subsystem: 0x45 (01000101)
INA260 Jetson Subsystem: 0x40 (01000000)

MCP9808 OBC Subsystem: 0x19 (0001 1001)
MCP9808 Perif. Subsystem: 0x1A (0001 1010)
MCP9808 Jet. Subsystem: 0x1B (0001 1011)

IMX8 SCALES Merger Board

Variant: Pre-Flight Testing Board

The IMX8 Scales Merger Board is a minimized version of the IMX8 Dev board combined with the SCALES EPS Board

Board Description:
Provided serial communications for end user: FTDI, UART, SPI, I2C
Power Input: From SCALES EPS Rev F (Hirose DF11 2x8 Connector)
Ethernet: 2, 10/100 Base-T RJ-45 Connectors
SPI/GPIO/I2C: Provided via Hirose DF11 2x8 Connector
SOM Connector: 2x140 proprietary Samtec Connector for IMX8QXP SOM

Description:
The SDCard/Wifi Mux(s) have been removed to allow for Default SDCard boot configuration and Utilization. If it is desired to use eMMC, then there must be a switch to toggle between boot modes, this is BOOTMODE[3:0] bits 0010 to eMMCand 0011 to SDcard respectively. Due to removal of all other boot configurations, we only need to switch the last bit using the provided switch we will include.

SD Card Power Enable Switch

Bootmode Toggler

SW1 Toggles Bootmode Bit 0, Bit 1 is always held high, and bits 2 and 3 are alwaysd held low. When SW1 is off, Bootmode0 is pulled up, defaulting to SD card. WHen SW1 is on, Bootmode 0 is pulled to GND, and eMMC is enabled.

uSD Card Connector

Description:
UART0 on the SOM is reserved for UART-FTDI usage. The default BSP configures the SOM to use UART0 for debugging, this allows the user to be able to use UART to send and recieve commands and telemetry with the SOM. The chip below facilitates UART to FTDI translation so that the end user can utilize a serial port on a seperate machine to interface directly. This design and chip are provided by Phytec.

10/100/1000 Ethernet

Description: Ethernet configuration and bootstrap modes are configured on the SOM.
This is all ported from the IMX8X dev board. There are two available Ethernet configurations for the SOM, one is preconfigured on the SOM with an onboard RGMII translator, and the second one is included in this carrier board.

Anything going to the SOM is single ended. 50ohm. Impedance Controlled.
